Bivariate interpolation at Xu points: results, extensions and applications. Len Bos, Marco Caliari, Stefano De Marchi, and Marco Vianello.

Abstract.
In a recent paper, Y. Xu proposed a set of Chebyshev-like points for polynomial interpolation on the square $[-1,1]^2$. We have recently proved that the Lebesgue constant of these points grows like $\log^2$ of the degree (as with the best known points for the square), and we have implemented an accurate version of their Lagrange interpolation formula at linear cost. Here we construct non-polynomial Xu-like interpolation formulas on bivariate compact domains with various geometries, by means of composition with suitable smooth transformations. Moreover, we show applications of Xu-like interpolation to the compression of surfaces given as large scattered data sets.

Alternative orthogonal polynomials and quadratures. Vladimir S. Chelyshkov.

Abstract.
A bidirectional orthogonalization algorithm is applied to construct sequences of polynomials, which are orthogonal over the interval $[0, 1]$ with the weighting function $1$. Functional and recurrent relations are derived for the sequences that are the result of inverse orthogonalization procedure. Quadratures, generating by the sequences, are described. An example on approximation of the Cauchy problem is given.

Abstract.
We show that the inverse monopolar or dipolar source problem in a 3D ball from overdetermined Dirichlet-Neumann data on the boundary sphere reduces to a family of 2D inverse branchpoint problems in cross sections of the sphere, at least when there are finitely many sources. We adapt from [L. Baratchart et al., Recovery of pointwise sources or small inclusions in 2D domains and rational approximation, Inverse Problems, 21 (2005), pp. 51–74] an approach to these 2D inverse problem which is based on meromorphic approximation, and we present numerical results.

Error controlled regularization by projection. Wolfgang Dahmen and Markus Jürgens.

Abstract.
The paper is concerned with regularization concepts for the inversion of diffusion processes. The application of the involved evolution operators is based on Dunford integral representations combined with the adaptive application of resolvents using recent wavelet methods. In particular, this allows us to develop and realize numerically, to our knowledge for the first time in this context, an SVD projection method which is compared to several versions of Tikhonov-type schemes. The theoretical
findings are complemented by numerical tests shedding some light on the quantitative performance of the schemes.

Quadrature-free quasi-interpolation on the sphere. *M. Ganesh and H. N. Mhaskar.*

**Abstract.**
We construct certain quasi-interpolatory operators for approximation of functions on the sphere, using tensor product scattered data satisfying certain symmetry conditions. Our operators are constructed without using any quadrature formulas. We use instead a special class of orthonormal bivariate trigonometric polynomials. These polynomials are functions on the sphere, and are constructed in a numerically stable way, based on the data locations. The quasi-interpolatory operators give near best approximation to every continuous function. We demonstrate our constructions numerically with several benchmark functions using randomly generated data locations.

**Abstract.**
The Euler integral representation of the $2F_1$ Gauss hypergeometric function is well known and plays a prominent role in the derivation of transformation identities and in the evaluation of $2F_1(a; b; c; 1)$, among other applications. The general $p+kF_{q+k}$ hypergeometric function has an integral representation where the integrand involves $pF_q$. We give a simple and direct proof of an Euler integral representation for a special class of $q+1F_q$ functions for $q \geq 2$. The values of certain $3F_2$ and $4F_3$ functions at $x = 1$, some of which can be derived using other methods, are deduced from our integral formula.

Weighted approximation of derivatives on the half-line. *Katherine Balázs and Theodore Kilgore.*

**Abstract.**
Weighted polynomial approximation of derivatives on the half line $[0, \infty)$ is considered. The weight function will be of the form $e^{-R(\cdot)}$, a “folded” Freud weight.
That is, that $R(x^2) = Q(x)$, where $e^{-Q(x)}$ is a Freud weight on $(-\infty, \infty)$. Linear processes which can be used for approximation of derivatives include interpolation, in particular using node-sets recently developed by J. Szabados.

**The circle theorem and related theorems for Gauss-type quadrature rules. Walter Gautschi.**

**Abstract.**
In 1961, P.J. Davis and P. Rabinowitz established a beautiful “circle theorem” for Gauss and Gauss–Lobatto quadrature rules. They showed that, in the case of Jacobi weight functions, the Gaussian weights, suitably normalized and plotted against the Gaussian nodes, lie asymptotically for large orders on the upper half of the unit circle centered at the origin. Here analogous results are proved for rather more general weight functions—essentially those in the Szegö class—, not only for Gauss and Gauss–Lobatto, but also for Gauss–Radau formulae. For much more restricted classes of weight functions, the circle theorem even holds for Gauss–Kronrod rules. In terms of potential theory, the semicircle of the circle theorem can be interpreted as the reciprocal density of the equilibrium measure of the interval $[-1, 1]$. Analogous theorems hold for weight functions supported on any compact subset $\Delta$ of $(-1, 1)$, in which case the (normalized) Gauss points approach the reciprocal density of the equilibrium measure of $\Delta$. Many of the results are illustrated graphically.

**New constructions of piecewise-constant wavelets. Youngmi Hur and Amos Ron.**

**Abstract.**
The classical Haar wavelet system of $L^2(\mathbb{R}^n)$ is commonly considered to be very local in space. We introduce and study in this paper piecewise-constant framelets (PCF) that include the Haar system as a special case. We show that any bi-framelet pair consisting of PCFs provides the same Besov space characterizations as the Haar system. In particular, it has Jackson-type performance $s_J = 1$ and Bernstein-type performance $s_B = 0.5$. We then construct two PCF systems that are either, in high spatial dimensions, far more local than Haar, or are as local as Haar while delivering better performance: $s_J = s_B = 1$. Both representations are computed and inverted by fast algorithms.

Bernstein’s weighted approximation on $\mathbb{R}$ still has problems. D. S. Lubinsky.

Abstract.
Let $W : \mathbb{R} \to (0, 1]$ be continuous. Bernstein’s approximation problem, posed in 1924, dealt with approximation by polynomials in the norm

$$\|f\|_W := \|fW\|_{L_{\infty}(\mathbb{R})}.$$

The qualitative form of this problem was solved by Ahieser, Mergelyan, and Pollard, in the 1950’s. Quantitative forms of the problem were actively investigated starting from the 1960’s. We survey old and recent aspects of this topic. One recent finding is that there are weights for which the polynomials are dense, but which do not admit a Jackson-Favard inequality. In fact the weight $W(x) = \exp(-|x|)$ exhibits this peculiarity. Moreover, not all $L_p$ spaces are the same when degree of approximation is considered. We also pose some open problems.

On norms of factors of multivariate polynomials on convex bodies. András Kroó.

Abstract.
Estimation of norms of factors of polynomials is a widely investigated extremal problem with numerous applications in functional analysis, number theory, approximation theory. In this note we study the following problem: let $K$ be a convex body
in \( \mathbb{R}^d \) and consider a product of polynomials \( qr \), where \( q \) is arbitrary and \( r \) is a monic multivariate polynomial. The goal is to find an upper bound for the uniform norm of \( q \) on \( K \) provided that such bound for \( qr \) is known.

224 Stable multiresolution analysis on triangles for surface compression. Jan Maes and Adhemar Bultheel.

**Abstract.**
Recently we developed multiscale spaces of \( C^1 \) piecewise quadratic polynomials on the Powell–Sabin 6-split of a triangulation relative to arbitrary polygonal domains \( \Omega \subset \mathbb{R}^2 \). These multiscale bases are weakly stable with respect to the \( L_2 \) norm. In this paper we prove that these multiscale spaces form a multiresolution analysis for the Banach space \( C^1(\Omega) \) and we show that the multiscale basis forms a strongly stable Riesz basis for the Sobolev spaces \( H^s(\Omega) \) with \( s \in (2, \frac{5}{2}) \). In other words, the norm of a function \( f \in H^s(\Omega) \) can be determined from the size of the coefficients in the multiscale representation of \( f \). This property makes the multiscale basis suitable for surface compression. A simple algorithm for compression is proposed and we give an optimal a priori error bound that depends on the smoothness of the input surface and on the number of terms in the compressed approximant.

259 Distribution of primes and a weighted energy problem. Igor E. Pritsker.

**Abstract.**
We discuss a recent development connecting the asymptotic distribution of prime numbers with weighted potential theory. These ideas originated with the Gelfond-Schnirelman method (circa 1936), which used polynomials with integer coefficients
and small sup norms on $[0, 1]$ to give a Chebyshev-type lower bound in prime number theory. A generalization of this method for polynomials in many variables was later studied by Nair and Chudnovsky, who produced tight bounds for the distribution of primes. Our main result is a lower bound for the integral of Chebyshev’s $\psi$-function, expressed in terms of the weighted capacity for polynomial-type weights. We also solve the corresponding potential theoretic problem, by finding the extremal measure and its support. This new connection leads to some interesting open problems on weighted capacity.

More examples on general order multivariate Padé approximants for pseudo-multivariate functions. *Ping Zhou.*

**Abstract.**
Although general order multivariate Padé approximants have been introduced some decades ago, very few explicit formulas have been given so far. We show in this paper that, for any given pseudo-multivariate function, we can compute its $(M, N)$ general order multivariate Padé approximant for some given index sets $M, N$ with
the usage of Maple or other software. Examples include a multivariate form of the sine function

\[ S(x, y) = (x + y) \sum_{i,j=0}^{\infty} (-1)^{i+j} \frac{x^{2i}y^{2j}}{(2(i+j)+1)!}, \]

a multivariate form of the logarithm function

\[ L(x, y) = \sum_{i+j \geq 1} \frac{x^i y^j}{i+j}, \]

a multivariate form of the inverse tangent function

\[ T(x, y) = (x + y) \sum_{i,j=0}^{\infty} (-1)^{i+j} \frac{x^{2i}y^{2j}}{2(i+j)+1}, \]

and many others.

Fourier–Bessel functions of singular continuous measures and their many asymptotics. Giorgio Mantica.

Abstract.
We study the Fourier transform of polynomials in an orthogonal family, taken with respect to the orthogonality measure. Mastering the asymptotic properties of these transforms, that we call Fourier–Bessel functions, in the argument, the order, and in certain combinations of the two is required to solve a number of problems arising in quantum mechanics. We discuss known results, new approaches and open conjectures, hoping to justify our belief that these investigations may involve interesting discoveries, well beyond the quantum mechanical applications.

On convergence of orthonormal expansions for exponential weights. H. P. Mashele.

Abstract.
Let $I = (-d, d)$ be a real interval, finite or infinite, and let $W : I \to (0, \infty)$. Assume that $W^2$ is a weight, so that we may define orthonormal polynomials corresponding to $W^2$. For $f : I \to \mathbb{R}$, let $s_m[f]$ denote the $m$th partial sum of the orthonormal expansion of $f$ with respect to these polynomials. We show that if $f'W \in L^\infty(I) \cap L^2(I)$, then $\| (s_m[f] - f) W \|_{L^\infty(I)} \to 0$ as $m \to \infty$. The class of weights considered includes even exponential weights.

From Taylor to quadratic Hermite–Padé polynomials. Herbert Stahl.

Abstract.
Taylor polynomials, Padé approximants, and algebraic Hermite-Padé approximants form a hierarchy of approximation concepts of growing complexity. In the present contribution we climb this ladder of concepts by reviewing results about the asymptotic behaviour of polynomials that are connected with the three concepts. In each case the concepts are used for the approximation of the exponential function. The review starts with a classical result by G. Szegő about the asymptotic behaviour of zeros of the Taylor polynomials, it is then continued with asymptotic results by E.B. Saff and R.S. Varga about the asymptotic behaviour of zeros and poles of Padé approximants, and in the last part, analogous results are considered with respect to quadratic Hermite-Padé polynomials. Here, known results are reviewed and some new ones are added. The new results are concerned with the non-diagonal case of quadratic Hermite-Padé polynomials.
